## SECTION 1

### INTRODUCTION

This Operations and Maintenance (O&M) Manual has been created as a guide for monitoring and maintaining the performance of the expanded bioventing blower systems and vent well plumbing at Site SS-41 (Former Building No. 93 Fuel Pumping Station 3), Charleston AFB, South Carolina. Record drawings of the expanded bioventing system installed at Site SS-41 are provided in Appendix A.

Bioventing is the forced injection of fresh air, or withdrawal of soil gas, to enhance the supply of oxygen in subsurface soils to promote *in situ* bioremediation of organic fuel compounds. A blower system is used to inject air into the soil, thereby supplying fresh atmospheric air (containing approximately 20.8 percent oxygen) to fuel-contaminated soils. Once oxygen is provided to the subsurface, existing soil bacteria aerobically metabolize the fuel residuals. Aerobic biodegradation is much more efficient than anaerobic biodegradation, which occurs in oxygen-depleted soils.

A pilot-scale bioventing system was installed and operated by Parsons ES at the site from July 1994 through August 1995. The pilot scale system consisted of two vertical vent wells (VWs) and four multi-depth soil vapor monitoring points (MPs) installed on the west side of the former underground storage tank (UST) system. Pilot test monitoring results showed that a large portion of the site was not being affected by the air injection, especially areas north and east of the pilot-scale system.

Parsons ES designed and installed a full-scale bioventing system to address the soil oxygen deficiency in areas with remaining soil contamination that were not treated by the pilot-scale system. The full-scale air injection bioventing system consists of two air injection blowers, ten new vertical VWs, ten new soil gas MPs, and associated piping. Existing pilot system VWs and MPs were incorporated into the full-scale system. The new system was installed at the site from February, 1997 through May, 1997. The air injection rates of the full-scale bioventing system were optimized at each vent well to assure adequate aeration of contaminated soils to promote aerobic biodegradation. Soil gas monitoring performed in May and June 1997, after several weeks of operating the new VWs, indicates the majority of the area designated for bioventing treatment is receiving sufficient oxygen. Most of these subsurface soils are receiving oxygen concentrations greater 15%, although several locations have shown less significant increases in soil gas oxygen content.

Charleston AFB personnel are responsible for routine monitoring of the bioventing system. Parsons ES has trained Charleston AFB personnel on the maintenance requirements of this plan. If significant problems are encountered with the operation of the system, Parsons ES should be notified so repairs can be made. Under the Extended Bioventing Project Option 1, Parsons ES is responsible for system repair for a 1-year period after system startup. Parsons ES will retain responsibility for system repair until May 1998. Should the bioventing system cease to operate or develop a significant problem, please call the Parsons ES Site Manager, Mr. Grant Watkins, at (919) 677-0080, or Mr. John Ratz, at (303) 831-8100. If the system ceases to operate, first have a base electrician verify that adequate power is being supplied to the bioventing system blower motor prior to notifying Parsons ES.

## SECTION 2

### SYSTEM DESCRIPTION

#### **2.1 BLOWER SYSTEM**

Two Gast® R5125Q blowers, each powered by a 2-horsepower direct drive motor, were installed at Site SS-41 on April 24-25, 1997. Each blower was installed in a separate enclosure, with both enclosures located on a single concrete pad. The R5125Q blower is rated as having a maximum flow rate of 160 standard cubic feet per minute (scfm) at open flow and a maximum pressure rating of 55 inches of water. As installed, the blower on the south side of the concrete pad (blower #1) provides air to five vent wells (VW-2 through VW-6) located on the south and east portions of the site. The blower on the north side of the concrete pad (blower #2) supplies air to six vent wells (VW-7 through VW-12), located primarily on the north and west sides of the site.

During initial system startup on May 9, 1997, blower #1 was producing an estimated flow rate of 15 actual cubic feet per minute (acf m) at a pressure of 34 inches of water. Blower #2 was started at a flow rate of 16.5 acf m at a pressure of 34 inches of water. The air injection flow rates were increased at both blowers on May 21-22, 1997 after soil gas monitoring indicated that some areas were not receiving adequate concentrations of soil gas oxygen. Final blower readings representative of longer term system performance were obtained on June 10, 1997. On that date, blower #1 (wells VW-2 through VW-6) was injecting air at 56 acf m at 29 inches of water pressure. Air flow rates to the individual wells ranged from a minimum of 1.9 acf m at VW-3 to a maximum of 22.1 acf m at VW-5. Blower #2 (wells VW-7 through VW-12) was operating at 43 acf m total air flow at 51 inches of pressure. Air flow rates to individual wells connected to the blower #2 ranged from 1.8 acf m at VW-9 to 17.8 acf m at combined wells VW-8/VW-12. Flow was optimized to each VW based on 1) the degree of hydrocarbon contamination present within soils in the vicinity of each VW, 2) the amount of oxygen measured at surrounding MPs following four weeks of operation, and 3) limitations to air injection due to variations in site physical characteristics. Generally, higher flow rates at lower pressures are observed in soils on the south and east part of the site. Air injection flow rates are lower and injection pressures generally are higher on the north end of the site.

The blower systems include an inlet air filter to remove any particulates which are entrained in the inlet air stream and several valves and monitoring gauges which are described in Section 2.2. A schematic of the expanded blower systems installed at Site SS-41 is shown in Appendix A. Corresponding blower performance curves and relevant service information are provided in Appendix B. Blower system data collection sheets for use by base personnel are provided in Appendix C.

#### **2.2 MONITORING AND FLOW CONTROL EQUIPMENT**

##### **2.2.1 Monitoring Gauges**

The bioventing system is equipped with vacuum, pressure, and temperature gauges, and air velocity measurement ports. Gauges have been installed on the air injection system at the

following locations: a vacuum gauge in the inlet piping and pressure and temperature gauges in the outlet piping on each blower.

## **2.2.2 Flow Control Equipment**

Manual and automatic flow control valves (FCVs) have been installed on the bioventing blower systems. Manual FCVs have been installed in the piping leading to each VW to enable the flow rate to each VW to be adjusted individually. An automatic FCV, or pressure relief valve (PRV), is used to protect each blower system from burning out if pressures rise due to pipe blockage. The PRV is set to bleed off flow at a preset pressure and thus prevent blower outlet pressure from ever exceeding the rated pressure.

An additional FCV (bleed valve) has been installed to control the total air flow out of each blower by releasing excess air flow to the atmosphere. The FCVs have been set by Parsons ES personnel to deliver a calculated amount of air to each VW and should not be adjusted unless directed to do so by Parsons ES personnel.

Each blower systems has also been equipped with air flow measurement ports. These ports consist of brass bushings installed in the outlet piping leading to each VW. These bushings, which should be plugged during system operation, allow the insertion of a thermal anemometer for the measurement of air velocity. These ports are used by Parsons ES for system optimization and should not be opened unless air flow measurements are being collected.

Although the blower systems installed at Site SS-41 are relatively maintenance free, periodic system maintenance is required for proper operation and long life. Recommended maintenance procedures and schedule are described in detail in the instruction manuals included in Appendix B and briefly summarized in this section.

Filter inspection must be performed with the system turned off. Do not change the flow control valve settings (valves have been pre-set for a specific flow rate) before re-starting the blower.

## SECTION 3

### SYSTEM MAINTENANCE

#### **3.1 BLOWER/MOTOR**

The blowers and their motors are relatively maintenance free and should not require any maintenance during the operational period. Both the blowers and motors have sealed bearings and do not require lubrication.

#### **3.2 AIR FILTER**

To avoid damage caused by passing solids through the blower, an air filter has been installed in-line before each blower. The paper filter element is accompanied by a polyurethane foam pre-filter. The filter should be checked weekly for the first 2 months of operation. A facility employee should determine the best schedule for filter replacement based on the first 2 months of system monitoring. The polyurethane pre-filters can be washed with lukewarm water and a mild detergent. Paper filter elements should never be washed, and should be disposed of and replaced as necessary. When the vacuum drop across the filter increases by approximately 5 inches of water compared to the vacuum when the filter was new, a dirty filter element should be suspected. Cleaning or replacement of the filter should then be performed. The initial vacuum when the filter element was new was 9 inches of water on Blower #1 (wells VW2-VW6) and 5 inches of water on Blower #2 (VW7-VW12). Therefore, the filters should be cleaned or replaced when the vacuum increases to 14 and 10 inches of water for each blower, respectively. Typical filter element replacement intervals range from 3 to 6 months.

To remove the filter, turn the system off by pushing the electrical disconnect switch (on the adjacent electrical utility pole) to the "off" position. Then, loosen the three clamps or the wing nut on the filter top, lift the metal top off the air filter, and lift the air filter element from the metal housing. Remove the polyurethane pre-filter (if applicable) and wash before replacing.

The filter element is manufactured by Solberg Manufacturing, Inc. in Itasca, Illinois. Their toll free telephone number is 1-800-451-0642. Additional filters can also be obtained through Parsons ES. The Parsons ES contacts are Mr. Grant Watkins, at (919) 677-0080, and Mr. John Ratz, at (303) 831-8100. The part number for the replacement filter element is 30P. Four spare air filter elements have been placed inside each blower enclosure.

#### **3.3 MAINTENANCE SCHEDULE**

The following maintenance schedule is recommended for the blower systems. During the initial few months of operation more frequent monitoring is recommended to ensure that any startup problems are quickly corrected. A daily drive-by inspection is recommended during the initial 2 weeks of operation to ensure that the blower system is still operating with no unusual sounds. Thereafter, monitoring inspections every 2 weeks are recommended (see Section 4). Preprinted data collection sheets have been provided to the facility. Extra data collection sheets for recording maintenance activities are provided in Appendix C.

<u>Maintenance Item</u>	<u>Maintenance Frequency</u>
Filter	Check once every 2 weeks, wash or replace as necessary (see Section 3.3). Inlet vacuums exceeding 14 inches of water (blower #1) or 10 inches of water (blower #2) indicates that the filters require cleaning or replacement.

### **3.4 MAJOR REPAIRS**

Regenerative blowers are very reliable when properly maintained. Occasionally, however, a motor or blower will develop a serious problem. If a blower system fails to start, and a qualified electrician verifies that power is available at the blower or starter, Parsons ES should be contacted to arrange for repairs. The Parsons ES contacts are Mr. Grant Watkins, at (919) 677-0080, and Mr. John Ratz, at (303) 831-8100. Parsons ES is responsible for major repairs during the first year of operation.

## **SECTION 4**

### **SYSTEM MONITORING**

#### **4.1 BLOWER PERFORMANCE MONITORING**

To monitor the blowers' performance, the vacuum, pressure, and temperature will be measured. These data should be recorded every 2 weeks on a data collection sheet (provided in Appendix C). All measurements should be taken at the same time while each system is running. Because the systems are noisy inside the enclosures, hearing protection should be worn at all times.

##### **4.1.1 Vacuum/Pressure**

With hearing protection in place, unlock and open the blower enclosure (the enclosure lids should be supported by the two metal pipes located inside each of the enclosures). Record all vacuum and pressure readings directly from the gauges (in inches of water) for each blower. Record the measurements on the data collection sheet.

##### **4.1.2 Temperature**

With hearing protection in place, open the blower enclosures and record the temperature readings directly from the gauges in degrees Fahrenheit ( $^{\circ}\text{F}$ ). Record the measurements on a data collection sheet (provided in Appendix C). The temperature change can be converted to degrees Celsius ( $^{\circ}\text{C}$ ) using the formula  $^{\circ}\text{C} = (^{\circ}\text{F} - 32) \times 5/9$ . Temperatures of the operating blower systems have varied from about 120-150  $^{\circ}\text{F}$  and will change slightly (decrease) once the enclosure lids are opened.

#### **4.2 MONITORING SCHEDULE**

The following monitoring schedule is recommended for these systems. During the initial month of operation, more frequent monitoring is recommended to ensure that any start up problems are quickly corrected. Data collection sheets have been provided to assist your data collection and are included in Appendix C.

<b><u>Monitoring Item</u></b>	<b><u>Monitoring Frequency</u></b>
Vacuum/Pressure	Once every 2 weeks.
Temperature	Once every 2 weeks.

#### **4.3 REPORTING MONITORING RESULTS**

System monitoring data sheets should be faxed to the Parsons ES Site Manager, Mr. Grant Watkins (919) 677-0080, once every 2 months. However, if a significant change in the system temperatures or pressures are noted (such as a significant drop or increase in pressure) please call Mr. Watkins immediately. A significant change in system temperature or pressure may be indicative of a problem with the air delivery system or blower.

## VACUUM

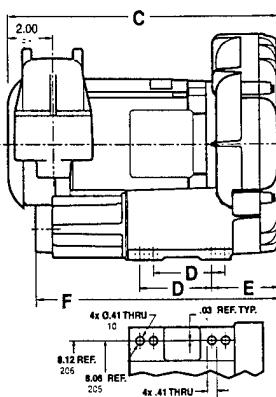

**Free software identifies best Gast blowers for soil and groundwater remediation**

Now you can size and select regenerative blowers and accessories for soil and groundwater remediation systems faster, easier and more accurately than ever before. Gast remediation system engineering software does the job and it is yours for the asking. The 3½-inch IBM-compatible disk calculates performance when the blower is operating with both a vacuum and pressure load at the same time. The programs will also compensate for changes in performance from altitude and temperature, helping you identify the optimum Gast blowers for your application.

## REGENAIR® R5 Series

### Product Dimensions Metric (mm) U.S. Imperial (inches)

### PRODUCT FEATURES

- Oilless operation
- TEFC motor mounted
- Can be mounted in any plane
- Rugged construction/low maintenance

### COMMON MOTOR OPTIONS

- 115/208-230V, 60 Hz, single phase
- 208-230/460V, 60 Hz; 190-220/380-415V, 50 Hz, three phase
- 575V, 60 Hz, three phase

### RECOMMENDED ACCESSORIES

- Pressure gauge AE133
- Filter AG338
- Muffler AJ121D
- Relief valve AG258

Various brand name motors are used on any model at the discretion of Gast Mfg. Corp.

### Important Notice:

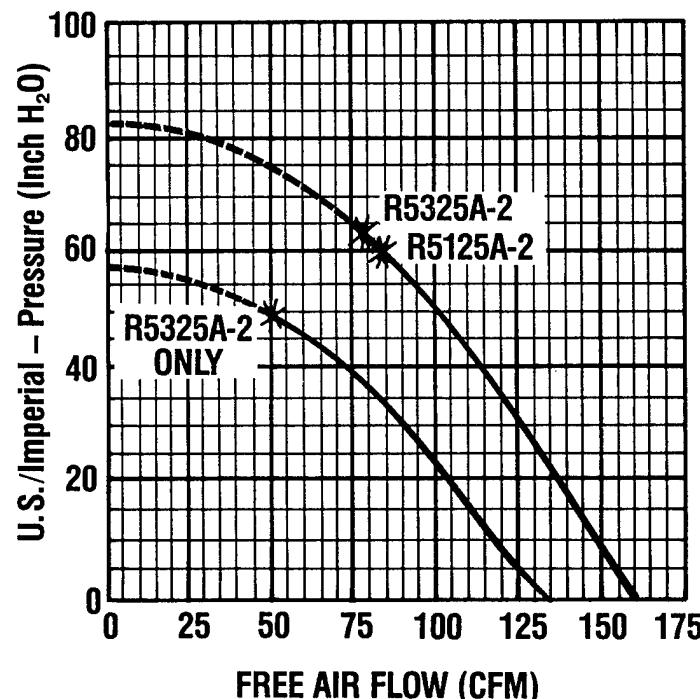

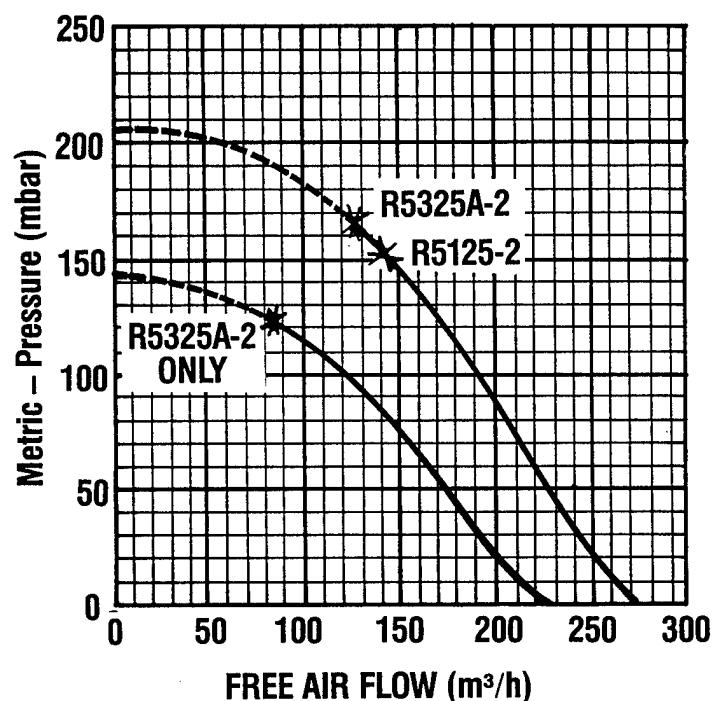

Pictorial and dimensional data is subject to change without notice.

• No lubrication needed at start up.  
Bearings lubricated at factory.

• Motor is equipped with clemite fitting.  
Clean tip of fitting and apply grease gun.  
Use 1 to 2 strokes of high quality ball  
bearing grease.

Consistency	Type	Typical Grease
Medium	Lithium	Shell Dodium R

Hours of service per year	Suggested Relube Interval
------------------------------	------------------------------

5,000 3 years

Continual Normal Application 1 year

Seasonal service motor  
idle for 6 months or more 1 year beginning  
of season  
6 months

Continuous-high ambient,  
dirty or moist applications.

All performance figures relate to stock models. A few high pressure units may be available. Consult your local distributor.

\*This number indicates the maximum static pressure differential recommended (with cooling air still flowing through unit). In general, units 1hp or less can be dead headed. Check with local representative or distributor to verify which models apply.

Operation of the blower above the recommended maximum duty will cause premature failure due to the build up of heat damaging the components.

Performance data was determined under the following conditions:

- 1) Unit in a temperature stable condition.
- 2) Test conditions: Inlet air density of 0.075lbs. per cubic foot. (20°C(68°F), 29.92 in. Hg(14.7PSIA)).
- 3) Normal performance variations on the resistance curve within +/- 10% of supplied data can be expected.
- 4) Specifications subject to change without notice.
- 5) All performance at 60Hz operation.

## OPERATING AND MAINTENANCE INSTRUCTIONS

### SAFETY

This is the safety alert symbol. When you see this symbol personal injury is possible. The degree of injury is shown by the following signal words:

**DANGER** Severe injury or death will occur if hazard is ignored.

**WARNING** Severe injury or death can occur if hazard is ignored.

**CAUTION** Minor injury or property damage can occur if hazard is ignored.

Review the following information carefully before operating.

### GENERAL INFORMATION

*This instruction applies to the following models ONLY: R3105N-50, R4110N-50, R4310P-50, R4P115N-50, R5125Q-50, R5325R-50, R6130Q-50, R6P155Q-50, R6350R-50, R6P355R-50 and R7100R-50.* These blowers are intended for use in Soil Vapor Extraction Systems. The blowers are sealed at the factory for very low leakage. They are powered with a U.L. listed electric motor Class I Div. 1 Group D motors for Hazardous Duty locations. Ambient temperature for normal full load operation should not exceed 40° C (105° F). For higher ambient operation, contact the factory.

Gast Manufacturing Corporation may offer general application guidance; however, suitability of the particular blower and/or accessories is ultimately the responsibility of the user, not the manufacturer of the blower.

### INSTALLATION

**DANGER** Models R5325R-50, R6130Q-50, R6350R-50, R5125Q-50, R6P155Q-50, R6P355R-50 AND R7100R-50 use Pilot Duty Thermal Overload Protection. Connecting this protection to the proper control circuitry is mandated by UL674 and NEC501. Failure to do so could may result in a EXPLOSION. See pages 3 and 4 for recommended wiring schematic for these models.

**WARNING** Electric shock can result from bad wiring. A qualified person must install all wiring, conforming to all required safety codes. Grounding is necessary.

**WARNING** This blower is intended for use on soil vapor extraction equipment. Any other use must be approved in writing by Gast Manufacturing Corp. Install this blower in any mounting position. Do not block the flow of cooling air over the blower and motor.

**PLUMBING** - Use the threaded pipe ports for connection only. They will not support the plumbing. Be sure to use the same or larger size pipe to prevent air flow restriction and overheating of the blower. When installing fittings, be sure to use pipe thread sealant. This protects the threads in the blower housing and prevents leakage. Dirt and chips are often found in new plumbing. Do not allow them to enter the blower.

**NOISE** - Mount the unit on a solid surface that will not increase the sound. This will reduce noise and vibration. We suggest the use of shock mounts or vibration isolation material for mounting.

**ROTATION** - The Gast Regenair Blower should only rotate clockwise as viewed from the electric motor side. The casting has an arrow showing the correct direction. Confirm the proper rotation by checking air flow at the IN and OUT ports. If needed reverse rotation of three phase motors by changing the position of any two of the power line wires.

### OPERATION

**WARNING** Solid or liquid material exiting the blower or piping can cause eye damage or skin cuts. Keep away from air stream.

**WARNING** - *Gast Manufacturing Corporation will not knowingly specify, design or build any blower for installation in a hazardous, combustible or explosive location without a motor conforming to the proper NEMA or U. L. standards.* Blowers with standard TEFC motors should never be utilized for soil vapor extraction applications or where local state and/or Federal codes specify the use of explosion-proof motors (as defined by the National Electric Code, Articles 100,500 c1990).

**CAUTION** Attach blower to solid surface before starting to prevent injury or damage from unit movement. Air containing solid particles or liquid must pass through a filter before entering the blower. Blowers must have filters, other accessories and all piping attached before starting. Any foreign material passing through the blower may cause internal damage to the blower.

**CAUTION** Outlet piping can burn skin. Guard or limit access. Mark "CAUTION Hot Surface. Can Cause Burns". Air temperature increases when passing through the blower. When run at duties above 50 in. H<sub>2</sub>O metal pipe may be required for hot exhaust air. The blower must not be operated above the limits for continuous duty. Only models R3105N-50, R4110N-50 and R4310P-50 can be operated continuously with no air flowing through the blower. Other units can only be run at the rating shown on the model number label. Do not Close off inlet (for vacuum) to reduce extra air flow. This will cause added heat and motor load. Blower exhaust air in excess of 230°F indicates operation in excess of rating which can cause the blower to fail.

**ACCESSORIES** ...Gast pressure gauge AJ496 and vacuum gauges AJ497 or AE134 show blower duty. The Gast pressure/vacuum relief valve, AG258, will limit the operating duty by admitting or relieving air. It also allows full flow through the blower when the relief valve closes.

## SERVICING

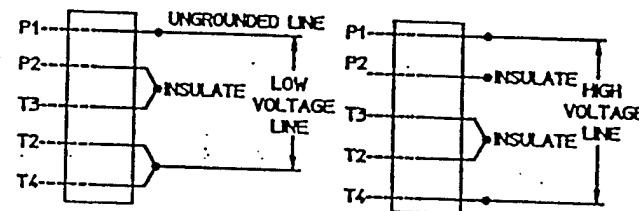

**WARNING** To retain their sealed construction they should be serviced by Gast authorized service centers ONLY. These models are sealed at the factory for very low leakage.

**WARNING** Turn off electric power before removing blower from service. Be sure rotating parts have stopped. Electric shock or severe cuts can result. Inlet and exhaust filters attached to the blower may need cleaning or replacement of the elements. Failure to do so will result in more pressure drop, reduced air flow and hotter opera-

tion of the blower. The outside of the unit requires cleaning of dust and dirt. The inside of the blower also may need cleaning to remove foreign material coating the impeller and housing. This should be done at a Gast Authorized Service Center. This buildup can cause vibration, failure of the motor to operate or reduced flow.

**KEEP THIS INFORMATION WITH THIS BLOWER.  
REFER TO IT FOR SAFE INSTALLATION,  
OPERATION OR SERVICE.**

## Moisture Separators

Moisture separators remove liquids from the gas stream in a vacuum process, helping protect the blower from corrosion and a buildup of mineral deposits.

Part No.	Liq. Cap. (gal.)	A(dia.)	Dim. B	C(NPT)	D(dia.)	Dim. E	Dim. F
RMS160	10	14.8"	37.5"	2"	2"	7.5"	26.6"
RMS200	19	19.7"	35"	2"	2"	7.5"	26.6"
RMS300	19	19.7"	35"	2.5"	2.5"	7.5"	26.6"
RMS400	40	24"	44"	3"	3"	9.7"	29"

## Part No. Product Type Description

Part No.	Product Type	Description	Used On
RMS160	Moisture separator	10 gallon liquid carrying capacity	R3, R4, R4P, R5 Blowers
RMS200	Moisture separator	19 gallon liquid carrying capacity	R4, R4P, R5, R6 Blowers
RMS300	Moisture separator	19 gallon liquid carrying capacity	R5, R6, R6P Blowers
RMS400	Moisture separator	40 gallon liquid carrying capacity	R6P, R7 Blowers
—	Float switch	Consult factory for appropriate style	RMS Series-Separators

## Filters

Since the blower impeller passes very close to the housing, it is always wise to have an in-line or inlet filter to ensure trouble free life.

### In-line (for vacuum)

Part No.	Dim. A	Dim. B	Dim. C	Dim. D	Dim. E
AJ151C	7.38"	6.81"	4.62"	1-1/4" FPT	1-1/4" FPT
AJ151D	7.38"	6.81"	4.62"	1-1/2" FPT	1-1/2" FPT
AJ151E	8.75"	10.25"	5.00"	2" FPT	2" FPT
AJ151G	8.00"	10.25"	5.50"	2-1/2" FPT	2-1/2" FPT
AJ151H	14.00"	26.50"	18.13"	3" MPT	3" MPT
AJ151L	14.00"	27.13"	18.50"	4" MPT	4" MPT

MPT = Male Pipe Thread FPT = Female Pipe Thread

All are heavy-duty for high amounts of particulates.

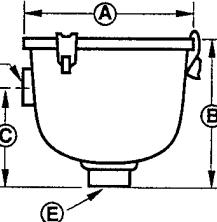

Inlet filters for REGENAIR® blowers are drip-proof when mounted as shown.

### For Vacuum Service

AJ151C	In-line filter	10 micron filter (replacement element AJ135E)	R3 Blower, R1H
AJ151D	In-line filter	10 micron filter (replacement element AJ135E)	R4, R4P, R3H Blowers, R2H
AJ151E	In-line filter	10 micron filter (replacement element AJ135F)	R5, R4H Blowers
AJ151G	In-line filter	10 micron filter (replacement element AJ135G)	R6, R6P Blowers, R7H, R8H, R9H
AJ151H	In-line filter	10 micron filter (replacement element AJ135C)	R7 Blower
AJ151L	In-line filter	10 micron filter (replacement element AJ135C)	R8M Blower

### Inlet (for pressure units only)

Part No.	Dim. A	Dim. B	Dim. C
AJ126C	6.00"	7.12"	1-1/4" MPT
AJ126D	7.70"	7.25"	1-1/2" MPT
AJ126F	10.63"	4.81"	2" FPT
AJ126G	10.00"	13.12"	2-1/2" MPT
AJ126L	10.00"	14.62"	4" MPT

MPT = Male Pipe Thread FPT = Female Pipe Thread

All are heavy-duty for high amounts of particulates.

Inlet filters for REGENAIR® blowers are drip-proof when mounted as shown.

### For Compressor-Inlet

AJ126C	Inlet filter	10 micron filter (replacement element AJ134C)	R3 Blower, R1H, 2067, 2567
AJ126D	Inlet filter	10 micron filter (replacement element AJ134E)	80 Series, 6066, 1290, R4, R4P, R5, R3H Blowers
AJ126F	Inlet filter	25 micron filter (replacement element AG340)	R6, R6P, R4H Blowers
AJ126G	Inlet filter	10 micron filter (replacement element AJ135A)	R7 Blower, R7H, R8H
AJ126L	Inlet filter	10 micron filter (replacement element AJ135H)	R8H Blower
AL355	Inlet filter	10 micron filter	0823

# ACCESSORIES

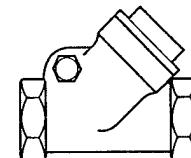

## Pressure-Vacuum Gauge

To monitor the system performance so maximum duties are not exceeded. Using two gauges (one on each side of the filter) is a great way to know when the filter needs servicing.

AJ497	Vacuum gauge	0-60" H <sub>2</sub> O, 1/4" NPT connection	Blowers
AE134	Vacuum gauge	0-160" H <sub>2</sub> O, 1/4" NPT connection	Blowers
AE134F	Vacuum gauge	0-15" HG, 1/4" NPT connection	H Series Blowers
AA644B	Pressure gauge	0-30 psi, 1/4" NPT	80 Series, 2567, 2067, 6066, 0823
AE133	Pressure gauge	0-160" H <sub>2</sub> O, 1/4" NPT connection	Blowers
AE133A	Pressure gauge	0-200" H <sub>2</sub> O, 1/4" NPT connection	Blowers
AE133F	Pressure gauge	0-15 psi, 1/4" NPT connection	R3H, R4H Blowers
AJ496	Pressure gauge	0-60" H <sub>2</sub> O, 1/4" NPT connection	SVE Blowers

## Check Valve

Designed to prevent back-wash of fluids that would enter the blower. Also prevents air back-streaming if needed. Can be mounted with discharge either vertical or horizontal. Valve will open with 3" of water pressure.

AH326D	Check valve	1-1/2" NPT (3" H <sub>2</sub> O cracking pressure)	Blowers
AH326F	Check valve	2" NPT (3" H <sub>2</sub> O cracking pressure)	Blowers
AH326G	Check valve	2-1/2" NPT (3" H <sub>2</sub> O cracking pressure)	R7 Blower

## Relief Valve

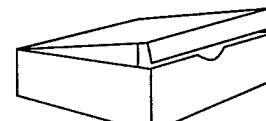

By setting a relief valve at a given pressure/vacuum you can ensure excessive duties will not harm the blower or products in your application.

AA307	Relief valve	For pressure, 3/4" NPT, adjustable 2-25 psi	6066, 2567 Series
AA600	Relief valve	For pressure, 3/8" NPT, adjustable 2-30 psi	0823
AG258	Relief valve	1-1/2" NPT adjustable 30-170" H <sub>2</sub> O, vac. or press., 200 CFM max.	Blowers
AG258F	Relief valve	2-1/2" NPT adjustable for higher flows, vacuum or pressure	Blowers
PV065	Relief valve	For pressure, pre-set for 6.5 psi, 1-1/4" NPT connection (60Hz)	R3H Blower
PV072	Relief valve	For pressure, pre-set for 7.2 psi, 1-1/4" NPT connection (60Hz)	R3H Blower
PV084	Relief valve	For pressure, pre-set for 8.4 psi, 1-1/4" NPT connection (50Hz)	R4H Blower, R8H, R9H
PV091	Relief valve	For pressure, pre-set for 9.1 psi, 1-1/4" NPT connection (50Hz)	R4H Blower, R9H
PV098	Relief valve	For pressure, pre-set for 9.8 psi, 1-1/4" NPT connection (50Hz)	R7H Blower
PV102	Relief valve	For pressure, pre-set for 10.2 psi, 1-1/4" NPT connection (60Hz)	R7H Blower
AN225	Relief valve	15-45 cfm, 3/4" NPT connection, adjustable 0-20 psi	2080, 3080, 4080 Series

## Service Kit

If pump performance on rotary vane models diminishes, installation of the Service Kit replacement parts will have it performing like new again.

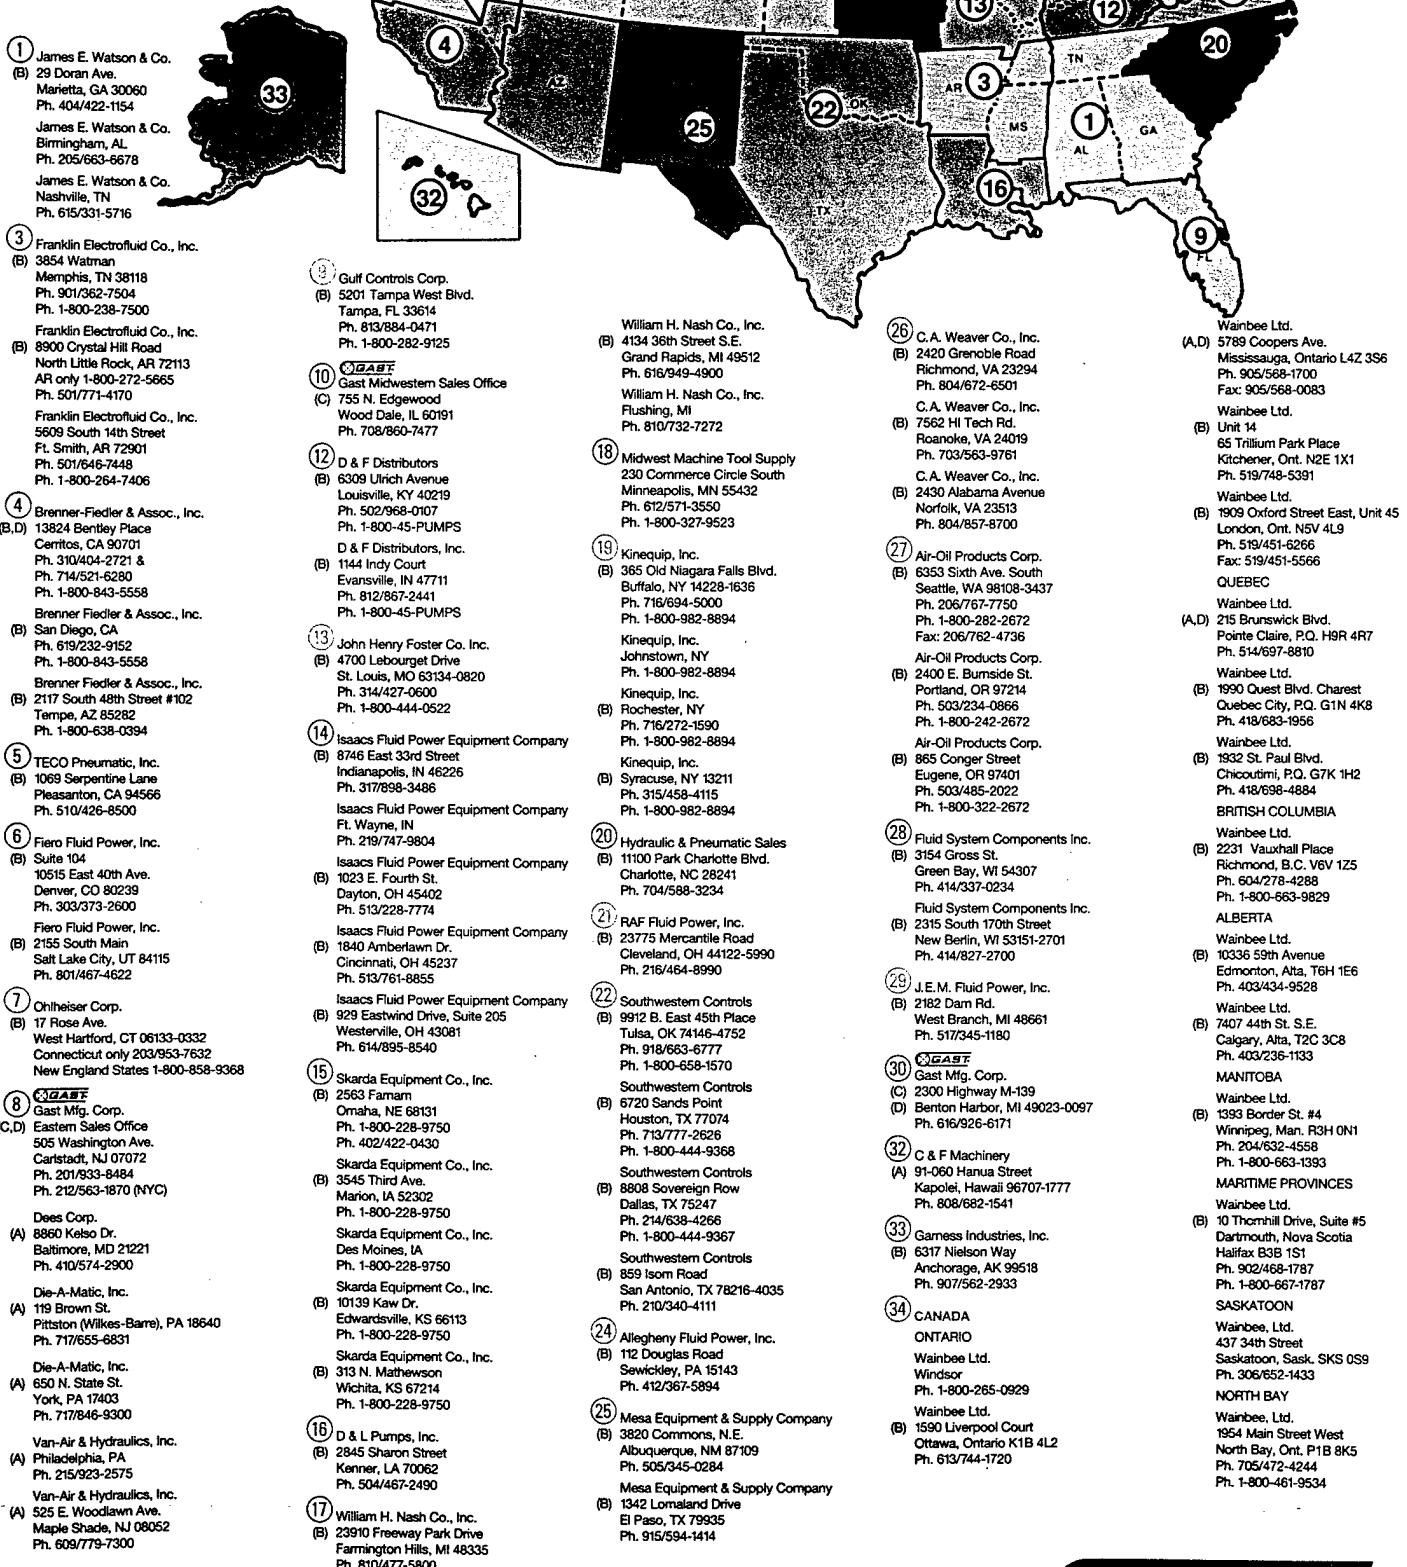

K479A	Service Kit	Includes items for unit repair	0823 Model
K504	Service Kit	Includes items for unit repair	6066, 1290 (uses 2)
K583	Service Kit	Includes items for unit repair	2567 Models
K584	Service Kit	Includes items for unit repair	2080, 3080, 4080 Models
K585	Service Kit	Filter/Muffler Kit only	2080, 3080, 4080 Models

# North American Representatives and Distributors

A substantial stock of vacuum pumps, compressors, air motors, parts and accessories are carried by the offices listed below.

- (A) Distributor-plant-use sales only.
- (B) Manufacturers Representative - O.E.M. and plant-use sales.
- (C) Gast warehouse and sales office - O.E.M. and plant-use sales.
- (D) Gast service center.

## **Warranty**

**REGARDLESS OF CAUSE**, if a product you buy from this brochure does not work right, Gast will repair or replace it once, at no charge, for up to one year from the date of shipment from the factory. In the course of repair or replacement, Gast may send you written recommendations on how to prevent a problem from happening again. Gast reserves the right to withdraw this warranty if you do not follow these recommendations. Customer is responsible for freight charges both to and from Gast in all cases. This warranty does not apply to electric motors, electrical controls, and gasoline engines, which Gast obtains from other manufacturers. A motor or engine carries only the warranty of the company that makes it.

THIS WARRANTY IS EXCLUSIVE AND IS IN LIEU OF ALL OTHER WARRANTIES, WHETHER WRITTEN, ORAL OR IMPLIED, INCLUDING THE WARRANTY OF MERCHANTABILITY AND OF FITNESS FOR ANY PARTICULAR PURPOSE. GAST'S LIABILITY IS IN ALL CASES LIMITED TO THE REPLACEMENT PRICE OF ITS PRODUCT. GAST SHALL NOT BE LIABLE FOR ANY OTHER DAMAGES, WHETHER CONSEQUENTIAL, INDIRECT, OR INCIDENTAL, ARISING FROM THE SALE OR USE OF ITS PRODUCTS.

Gast's sales personnel may modify this warranty, but only by signing a specific, written description of any modifications.

## **DISCLAIMER**

The information presented in this catalog is based on technical data and test results of nominal units. It is believed to be accurate and is offered as an aid in the selection of Gast products. It is the user's responsibility to determine suitability of the product for his intended use and the user assumes all risk and liability whatsoever in connection therewith.
